but we know what you’re up against.”™***

Moving AP Steel

No-threat/threat drills

Long range sniper training

THE AIM-MAPS™ (MOVING ARMOR PLATE SYSTEM)

SYSTEM OVERVIEW

- § The AIM-MAPS is a self-contained, battery-driven, ruggedized armor plate target mover. No drive gears, cables, concrete pad or external electrical power are required. Two, 12 volt, gel-cell batteries operate system for up to 10 hours.
- § The light-weight system is easily transported in a pick-up or ATV for training at various range distances. The system goes from transport to fully operational in minutes. The system can train shooters close-in during the morning and then be quickly moved and set-up for long-range training drills. The shooters ability to calculate bullet trajectories and wind variance compensation skills can be tested on moving targets.
- § Three remotely selectable target “wobble” speeds - Slow, Medium and Fast for truly realistic training.
- § Handheld remote controls target movements and carriage speeds at distances up to 200 yard. (1 mile with optional long-range remote.)
- § Hi-intensity white and red strobe assembly provides the shooter and instructor with instantaneous visual feedback of accurate or inaccurate bullet hits. (No variability due to wind noise.) Because the instructor/shooters do not have to go down range to score targets multiple shooters or teams can be trained at the same time. The instructor controls target movement and assesses each shooter’s skill by watching the illumination of the strobe(s).
- § The interchangeable AP 500 Brinell steel targets (head only and head/body) install in minutes and are usable with any handgun caliber and rifles up to .308 caliber.
- § Standard IPSIC cardboard targets can be used as no-threats in front of the AP steel.
- § Standard cardboard-backed LE or military targets can be positioned in the front target mount as a stand-alone moving humanoid target.
- § ITS proprietary polymer targets can be used as stand alone threat target or as both threat and no-threat simultaneously. These reactionary targets can be used with any high-energy rifle round including the .50 BMG round
- § For shooters new to truly *moving targets* (targets that move in a human like manner; not targets that simply turn to face you) the instructor can select a “smooth” and rhythmic target motion.
- § For advanced shooters the instructor can select auto-run programs that continually move the targets with random motions and varying speeds. This unique and patented capability allows the instructor to concentrate on training the shooter(s) and not be distracted by having to control the target movements.

REMOTE CONTROLLED MOTOR DRIVE UNIT (MDU)

§ Operator selections:

- Motor drive "ON/OFF".
- STEADY target "wobble" motion for new shooter training.
- UNPREDICTABLE target motion - the computer controller unpredictably turns the drive motor drive ON and OFF. This proprietary capability randomly alters target motions thereby mimicking human threat and hostage/innocent movements.

§ Variable target "wobble" speeds:

- SLOW for shooters with little shooting experience.
- MEDIUM for intermediate shooters.
- FAST for experienced marksmen, HRT and SWAT members.

§ Instructor Remote Control (IRC) operates up to 200 meters. Optional Long-Range Remote operates out to 1 mile.

§ 12 volt, sealed, gel-cell batteries operate the system for a full day of training.

§ Automatic battery chargers included.

AIM-TS (Training Seminar)

§ Two-day Training Seminar covers the set-up and operation of the AIM-MAP System and accessories.

§ Includes demonstrations of unique techniques and training scenarios developed in conjunction with the staff at the Albuquerque Police Tactical Firearms Training Complex and other weapons training instructors.

Proudly designed and manufactured in the USA. INTELLIGENT TARGET SYSTEMS is a veteran owned company.

Specifications and pricing subject to change without notice.

Quoted prices do not include shipping and handling or applicable taxes.
